

Forward-looking statements

Statements in this presentation contain "forward-looking statements" within the meaning of the Private Securities Litigation Reform Act of 1995 as contained in Section 27A of the Securities Act of 1933, as amended, and Section 21E of the Securities Exchange Act of 1934, as amended, which are subject to the "safe harbor" created by those sections. All statements, other than statements of historical facts, may be forward-looking statements. Forward-looking statements contained in this news release may be identified by the use of words such as "believe," "may," "should," "expect," "anticipate," "plan," "believe," "estimated," "potential," "intend," "will," "can," "seek," or other similar words. Examples of forward-looking statements include, among others, statements relating to current and future clinical development of EryDex, including a pivotal trial for Ataxia-Telangiectasia, potential commercial-stage inflection point for EryDex, and expansion of the company's proprietary Autologous Intracellular Drug Encapsulation (AIDE) technology for treatment of other rare diseases; the strategic development path for EryDex; planned regulatory agency submissions and clinical trials and timeline, prospects, and milestone expectations; the timing and success of the clinical trials and related data, including plans and the ability to initiate, fund, conduct, and/or complete current and additional studies; research and development costs; the company's future development plans and related timing; cash position and projected cash runway; the company's focus, objectives, plans, and strategies; and the company's market opportunity. Forward-looking statements are based on Quince's current expectations and are subject to inherent uncertainties, risks, and assumptions that are difficult to predict and could cause actual results to differ materially from what the company expects. Further, certain forwardlooking statements are based on assumptions as to future events that may not prove to be accurate. Factors that could cause actual results to differ include, but are not limited to, the risks and uncertainties described in the section titled "Risk Factors" in the company's Annual Report on Form 10-k filed with the Securities and Exchange Commission (SEC) on April 1, 2024, and other reports as filed with the SEC. Forward-looking statements contained in this presentation are made as of this date, and Quince undertakes no duty to update such information except as required under applicable law.

Quince Therapeutics investment highlights

Acquisition closed on October 20, 2023

Recently completed transformative acquisition of EryDel S.p.A.

Rare disease focused with compelling Phase 3 lead asset, EryDex, for potential treatment of Ataxia-Telangiectasia (A-T) with currently no approved treatments and \$1+ billion* peak commercial opportunity globally

Phase 3 lead asset EryDex enrollment planned for second quarter 2024

Risk-mitigated clinical and regulatory approach supported by optimized clinical trial design, special protocol assessment (SPA) agreement with FDA, and encouraging Phase 3 clinical trial results in prior study

Strong balance sheet to achieve meaningful clinical inflection point

Well-capitalized with sufficient cash runway into 2026 expected to fund EryDex through Phase 3 topline results and prepare for a potential NDA submission in 2026, assuming positive study results

Unique drug/device combination with high barriers to entry

- One-touch, fully automated, and sterile Autologous Intracellular Drug Encapsulation (AIDE) device
- Designed to deliver therapeutic in patient's own red blood cells distinct from standard cell or gene therapy
- Flexible technology designed to deliver wide range of therapeutics from small and large molecules to biologics
- CE mark in Europe with strong patent protections and IP exclusivity until at least 2034 globally & 2035 in U.S. without patent term adjustment or extension

20+ years of research & development and \$100 million invested in Autologous Intracellular Drug Encapsulation technology

Unlocking the potential of a patient's own biology

to deliver innovative and life-changing therapeutics to those living with rare diseases

A Autologous

Intracellular

D Drug

E Encapsulation

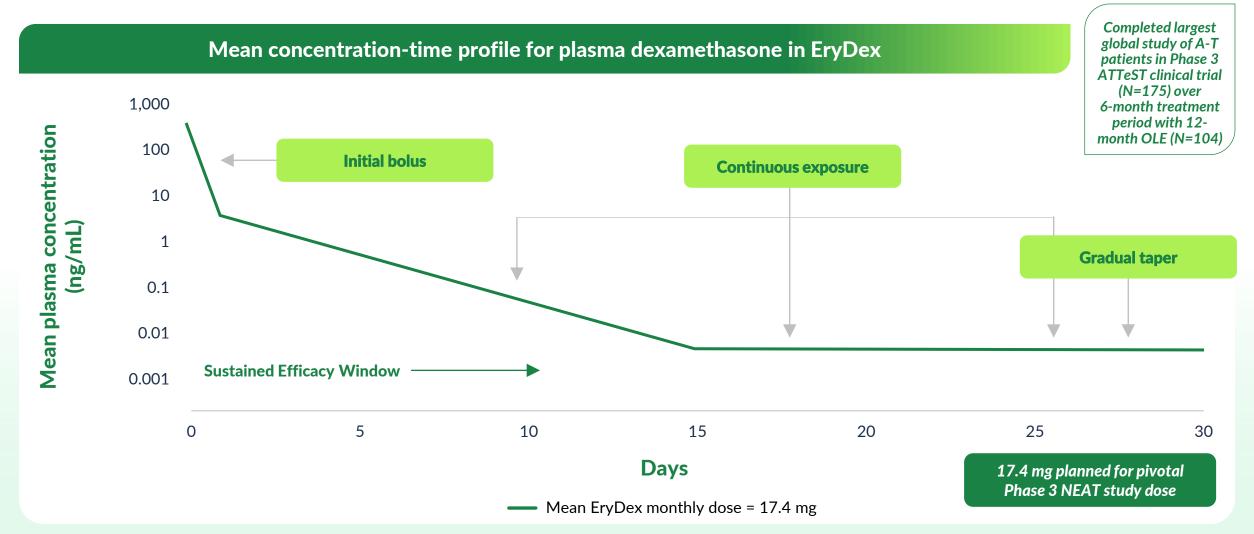

Proprietary AIDE technology process

- Patient's own blood collected and loaded into device using consumable treatment kit for fully automated and sterile processing
- AIDE processes red blood cells to encapsulate therapeutic of interest dexamethasone sodium phosphate (DSP) in case of lead asset, EryDex
- Result of the process is DSP loaded red blood cells that are washed, isolated, and prepared no gene editing or conditioning regimen required
- Proprietary process results in DSP encapsulated in autologous red blood cells that is then infused into patient
- Approximately two-hour process designed for monthly outpatient administration, if approved
- Designed to fundamentally alter biodistribution and pharmacokinetics of DSP to allow for sustained therapy mitigating chronic toxicity associated with long-term steroid use

EryDex designed to optimize dexamethasone delivery through once monthly dosing in A-T patients

Why are conventional corticosteroids toxic?

Well-described dose-limiting toxicity of corticosteroids

Adrenal suppression

- Low cortisol levels
- Cushingoid appearance
- Hirsutism
- Loss of bone mineral density
- Growth retardation in pediatrics
- Delay in puberty

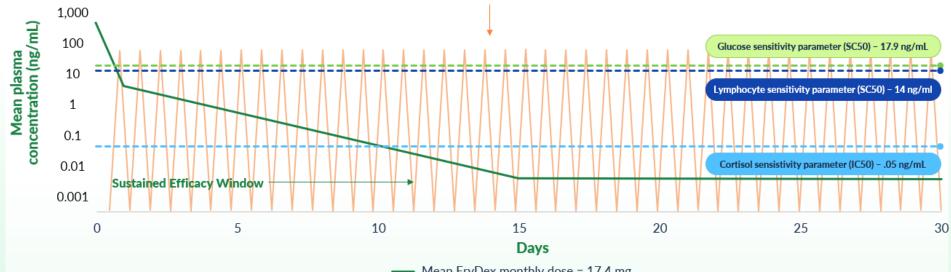

Elevated glucose resulting in hyperglycemia and diabetes

Immunosuppression resulting in infections

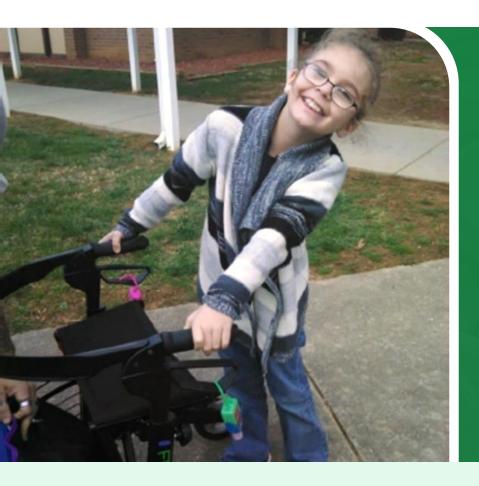

Pharmacokinetic profile of oral/IV daily administration of dexamethasone (6 mg)

Mean EryDex monthly dose = 17.4 mg

Note: Information represented does not reflect a completed comparative study of EryDex versus oral/IV administration of dexamethasone, but rather provides a comparison of published corticosteroid pharmacokinetic information relative to company data regarding EryDex. IC50 and SC50 refer to pharmacodynamic parameters of which IC50 reflects drug concentration eliciting 50% of the maximum inhibition and SC50 reflects drug concentration eliciting 50% of the maximum stimulation. References: Company prior Phase 3 ATTeST clinical trial data (ClinicalTrials.gov ID: NCT02770807); Montanha et al, Frontiers in Pharmacology (2022) 13: 814134: Krzyzanski et al. Journal of Pharmacokinetics and Pharmacodynamics (2021) 48: 411-438: Aliebab et al. PLOS ONE (2017) 10: 1371.

No currently approved treatments for A-T patients

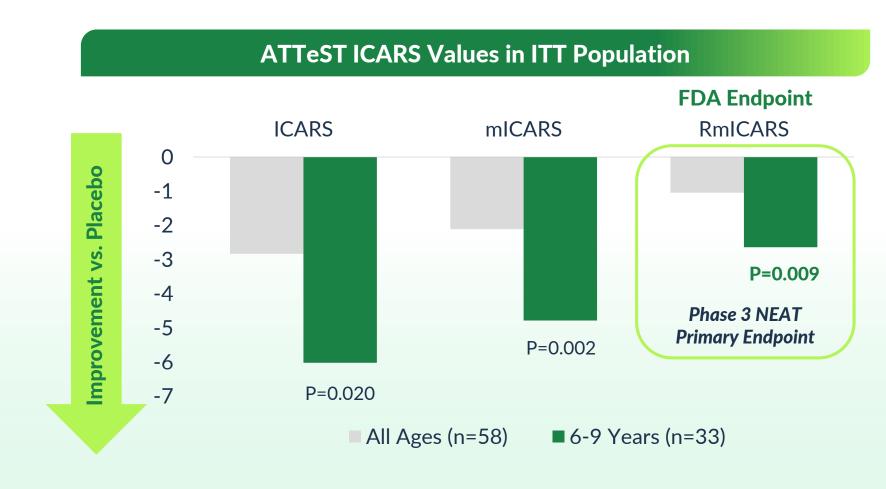

- A-T is an inherited rare neurodegenerative and immunodeficiency disorder caused by mutations in ATM gene
- \bigcirc Approximately 10,000 A-T patients in U.S., U.K., and EU4 countries*
- Neurological symptoms worsen until patients are wheelchair dependent, usually by age 12 with teenage years typically marked by repeated infections, pulmonary impairment, and malignancies
- Median lifespan of approximately 25-30 years
- Currently no approved treatments for A-T and no currently known effective approaches to delay progression of disease

Encouraging EryDex Phase 3 clinical trial results in prior ATTeST study

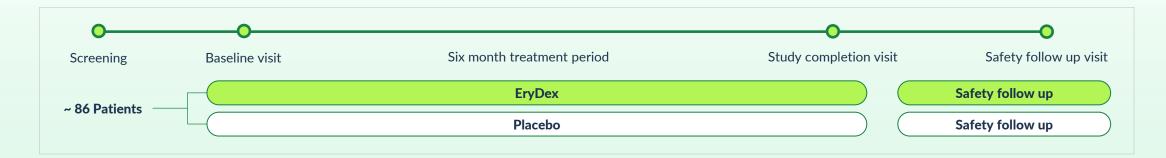

- Improvement observed in 6 to 9 year-old subgroup across multiple endpoints
- At 12 months, EryDex well-tolerated with no serious safety concerns
- 3+ years of ATTeST OLE observed no serious safety concerns
- Apply key learnings from ATTeST to pivotal NEAT study

Pivotal Phase 3 NEAT study design

- Pivotal study to be conducted under Special Protocol Assessment (SPA) agreement with FDA Allows for NDA submission, assuming positive results, following a single global Phase 3 NEAT study
- Randomized, double-blind, placebo-controlled study with six infusions scheduled once every 21 to 30 days Plan to enroll first patient in global Phase 3 NEAT clinical trial of EryDex in second quarter 2024
- Plan to enroll approximately 86 patients with A-T ages 6 to 9 years old (primary analysis population)
 Approximately 20 additional patients with A-T ages 10 years or older also will be included
 Participants will be eligible to transition to an open label extension (OLE) study

Attractive commercial opportunity for EryDex lead indication

\$1+ billion*

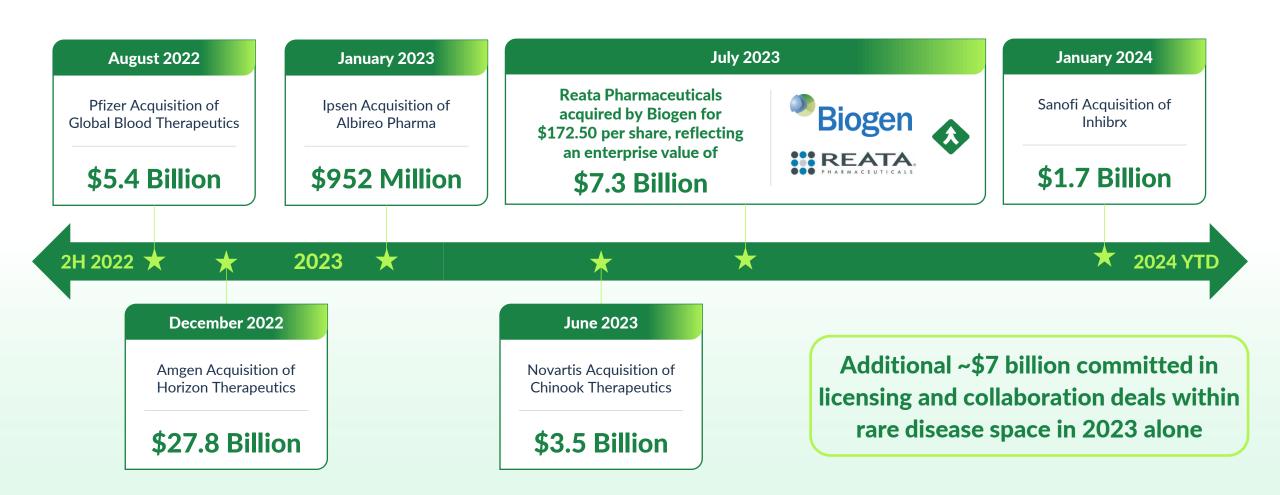

estimated global peak commercial opportunity for A-T indication alone

EryDex for A-T

- Approximately 10,000 patients with A-T* in U.S., U.K., and EU4 countries with currently no approved A-T therapies
- First-to-market potential with no known late-stage competition and granted orphan drug designation for the treatment of A-T from FDA and EMA
- Attractive rare disease pricing comparables with recently approved treatment for Friedreich's ataxia indication
- Highly scalable manufacturing infrastructure in place with low direct cost of goods less than 1% of comparable rare disease pricing
- European/U.S. orphan drug designation and strong patent protections with IP exclusivity until at least 2034 globally and 2035 in the U.S. without patent term adjustment or extension

Recent transaction activity in rare disease space

Seasoned leadership team

CEO & CMO

Dirk Thye, M.D.

- 20+ years of experience in biotech executive leadership, company creation, R&D, and drug discovery
- Agenovir, Cidara, Cerexa, Peninsula

COO, CBO, & PFO

Brendan Hannah, M.B.A.

- 15+ years leading biotech BD, finance, and business operations
- Led BD at Agenovir (acquired by Vir Biotech for up to \$290 million)
- Involved in \$2+ billion in transactions

CCO

Thomas Sabia, M.B.A.

- 20+ years of drug commercialization and development experience across large, midsize, and small biotech organizations
- Spark Therapeutics (a Roche Company), Sobi, CSL Behring, Sanofi

СТО

Giovanni Mambrini, MSc

- 20+ years of medical device technology experience with crossfunctional expertise in bringing complex programs to market
- Co-founded EryDel with prior experience at Covidien, Dideco, Livanova

President

Charles Ryan J.D., Ph.D.

- 25+ years of experience in pharmaceuticals and biotech executive leadership, legal, IP, finance, and development
- Forest Laboratories, Travecta, Neurotrope

Head of Regulatory

Pamela Williamson, RAC, FRAPS, M.B.A.

- 30+ years of regulatory affairs, quality assurance, pharmacovigilance, health authority compliance and manufacturing operations experience
- Alexion Pharmaceuticals, Genzyme Corporation, Serono/Ares-Serono

VP, Clin Dev

Maureen Roden, M.S.N.

- 30+ years of drug development experience and executive leadership
- Luna Consulting, BSPI, National Cancer Institute

VP, CMC

Gary Ward, Ph.D.

- 30 + years managing chemistry, manufacturing, and controls and product development operations
- Expert in broad range of NCE types/product dosage forms
- Pfizer, Dura Pharma, Chugai Biopharma, 3M Company

Well-capitalized with sufficient cash runway into 2026

\$75.1 million in cash, cash equivalents, and short-term investments as of December 31, 2023

Capital efficient development plan funds:

- EryDex through Phase 3 NEAT topline results and preparing for potential NDA submission, assuming positive study results
- NEAT study and OLE direct trial costs of ~\$20 million and ~\$15 million, respectively
- Investigation of other potential indications for EryDex
- Evaluation of additional potential applications of AIDE technology for new rare and debilitating diseases

Evaluate potential strategic partnerships to out-license of ex-U.S. regional territories to provide additional operating runway

Key clinical and corporate milestones

2024

- Omplete start up activities for Phase 3 NEAT clinical trial
- Enroll first patient in Phase 3 NEAT clinical trial in second quarter 2024
- Determine other potential indications for EryDex and initiate R&D activities
- Initiate R&D activities for at least one new program utilizing AIDE technology

2025

- Phase 3 NEAT clinical trial topline results
- Prepare for potential NDA submission in 2026, assuming positive study results
- At least one new clinical study for additional EryDex indication
- Potential out-licensing of ex-U.S. regional territories to provide runway through approval

Appendix

How can efficacy be maintained without toxicity?

Principles of corticosteroid delivery resulting in optimal efficacy

Clinical efficacy depends on the *magnitude* and *duration* of exposure to glucocorticoid receptors (GR)

Optimal results achieved by initial bolus dose to achieve GR saturation

EryDex delivers approximately 40% of initial 17 mg dexamethasone dose 24 hours after release

Followed by continuous infusion to maintain levels at GR sites

EryDex technology slowly releases dexamethasone through patient's own red blood cells over 21-28 days producing sustained delivery

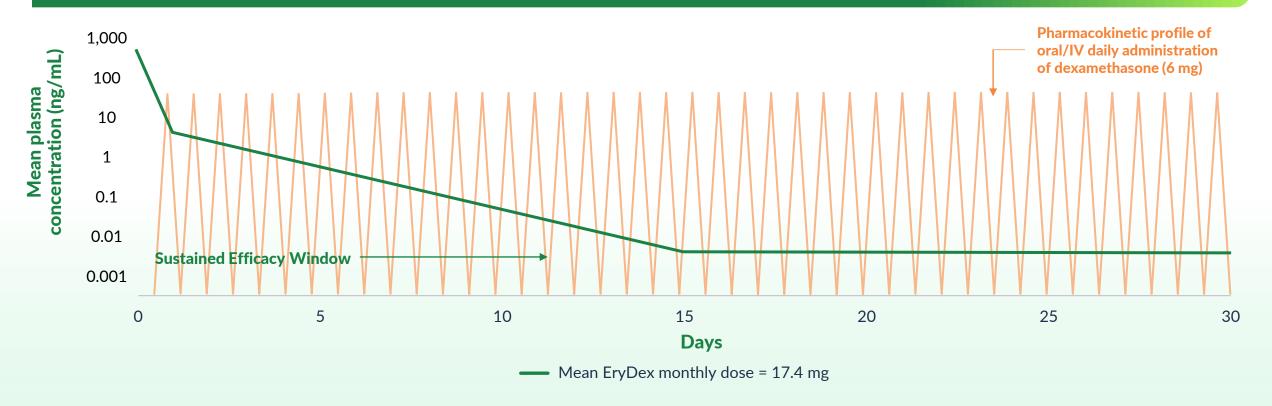

Then dose-tapering to achieve gradual recovery of suppressed HPA axis

EryDex delivery of dexamethasone from red blood cells results in slow and steady taper not reaching toxicity thresholds

Comparison of pharmacokinetic profiles between EryDex and monthly dexamethasone oral/IV administration using published PK information

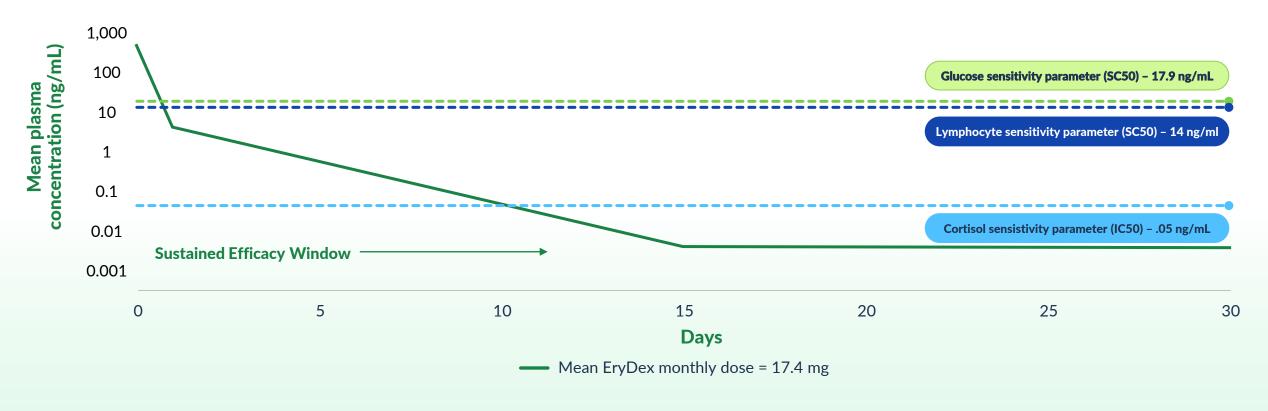

Note: Information represented does not reflect a completed comparative study of EryDex versus oral/IV administration of dexamethasone, but rather provides a comparison of published corticosteroid pharmacokinetic information relative to company data regarding EryDex. References: Company prior Phase 3 ATTeST clinical trial data (*ClinicalTrials.gov ID: NCT02770807*); Montanha et al, *Frontiers in Pharmacology* (2022) 13: 814134; Świerczek A, Jusko WJ., *Clinical and Translational Science* (2023) 16(9):1667-1679.

EryDex concentrations with monthly dose remained well below IC50 associated with toxicity

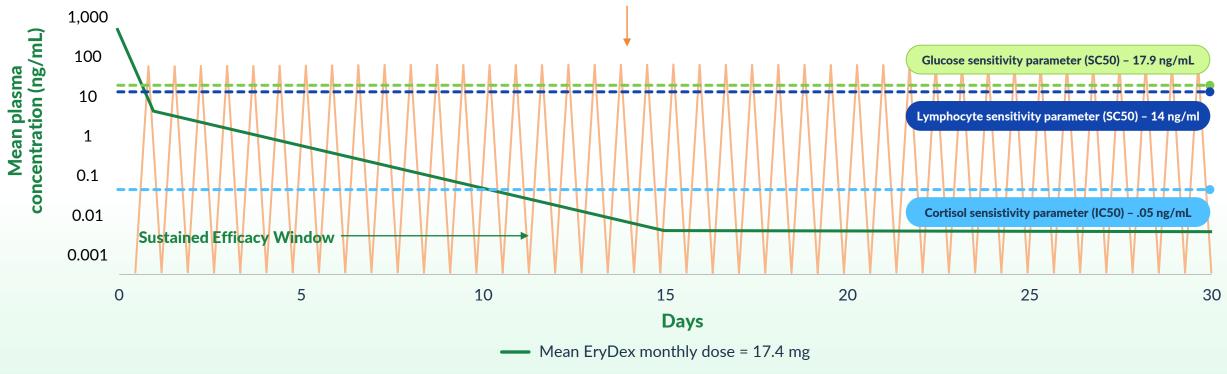

Note: Information represented does not reflect a completed comparative study of EryDex versus oral/IM administration of dexamethasone, but rather provides a comparison of published corticosteroid pharmacokinetic information relative to company data regarding EryDex. IC50 and SC50 refer to pharmacodynamic parameters of which IC50 reflects drug concentration eliciting 50% of the maximum inhibition and SC50 reflects drug concentration eliciting 50% of the maximum stimulation. References: Company prior Phase 3 ATTeST clinical trial data (ClinicalTrials.gov ID: NCT02770807); Montanha et al, Frontiers in Pharmacology (2022) 13: 814134; Krzyzanski et al, *Journal of Pharmacokinetics and Pharmacodynamics* (2021) 48: 411-438.

Daily dexamethasone administration led to peaks above IC50 associated with toxicity

Note: Information represented does not reflect a completed comparative study of EryDex versus oral/IV administration of dexamethasone, but rather provides a comparison of published corticosteroid pharmacokinetic information relative to company data regarding EryDex. IC50 and SC50 refer to pharmacodynamic parameters of which IC50 reflects drug concentration eliciting 50% of the maximum inhibition and SC50 reflects drug concentration eliciting 50% of the maximum stimulation. References: Company prior Phase 3 ATTeST clinical trial data (*ClinicalTrials.gov ID: NCT02770807*); Montanha et al, Frontiers in Pharmacology (2022) 13: 814134; Krzyzanski et al, Journal of Pharmacokinetics and Pharmacodynamics (2021) 48: 411-438; Świerczek A, Jusko WJ., Clinical and Translational Science (2023) 16(9):1667-1679.

Encouraging EryDex Phase 3 clinical trial results in prior ATTeST study

- Ompleted largest global study of A-T patients in Phase 3 ATTeST clinical trial and OLE
 - Double-blind, placebo-controlled study (N=175) over 6-month treatment period with 12-month OLE (N=104)
 - Patients randomized 1:1:1 to EryDex low dose, high dose, or placebo
 - Primary endpoint: mICARS Secondary endpoints: CGI-C QOL VABS
- Study observed EryDex slowed neurological deterioration in all ages of A-T patients with improvement observed in 6- to 9-year-old subgroup across multiple endpoints
- (2) 12-month safety analysis observed EryDex well-tolerated with no serious safety concerns typically associated with chronic steroid administration
- OE mark already obtained in Europe for treatment device and consumables kit

Prior Phase 3 study observed EryDex slowed neurological deterioration in all ages of A-T patients

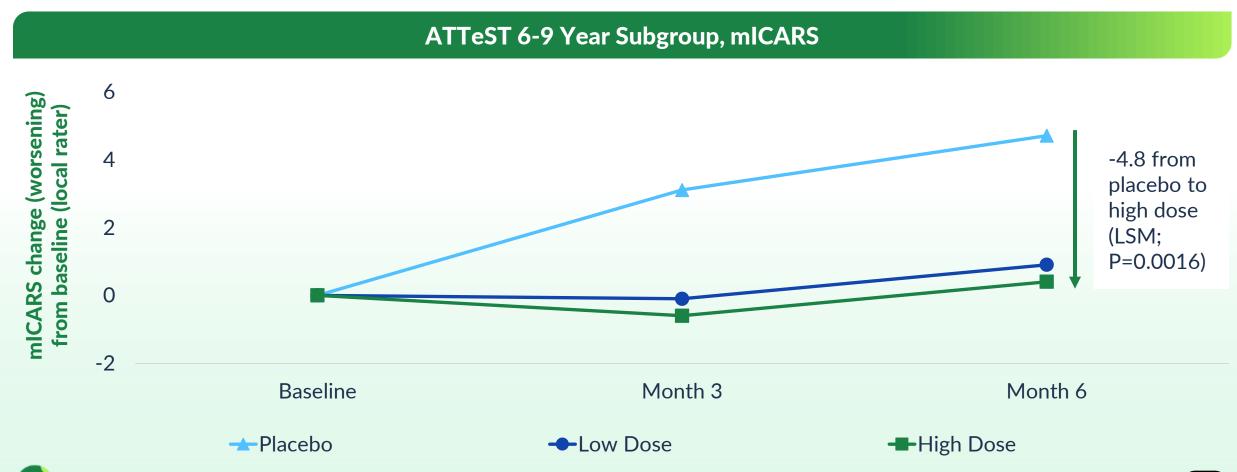

Prior Phase 3 study observed EryDex improvement in 6- to 9-year-old subgroup across multiple endpoints

Primary population selected for Phase 3 NEAT clinical trial

Prior Phase 3 study observed EryDex well-tolerated with no serious safety concerns

Expansion potential of EryDex and AIDE technology into additional rare disease indications

A Autologous

Intracellular

D Drug

E Encapsulation

EryDex system for indications beyond A-T

- Investigating other potential indications for EryDex system where chronic steroid treatment is – or has the potential to become – a standard of care
- Evaluation process expected to span across ataxias, neuromuscular indications, hematology, cancer, and autoimmune diseases, with a focus on rare diseases

Rare and debilitating disease expansion potential

- Flexible technology designed to deliver range of therapeutics from small and large molecules to biologics
- Evaluation of additional potential applications of AIDE technology platform for new rare and debilitating disease programs already underway
